Shangqin Hao

s2hao@ucsd.edu | shangqinhao.github.io

La Jolla, CA 92093, United States

Education

- **University of California San Diego** *Sept., 2020 - Now*
  Ph.D. candidate in Geophysics, Advisor: Dr. Peter M. Shearer La Jolla, United States
- **University of Science and Technology of China** *Sept., 2017 - Jul., 2020*
  M.S. in Geophysics, Advisor: Dr. Zhongqing Wu Hefei, China
- **Nanjing University** *Sept., 2013 - Jul., 2017*
  B.S. in Geology, Advisor: Dr. Zhongqing Wu, Dr. Tao Wang Nanjing, China

Projects

- **Substantial global radial variations of basalt content near the 660-km discontinuity** *May, 2023 - Oct., 2024*
  - Constrained seismic velocity, density, and basalt content at and below the 660-km discontinuity (d660) by *S660S* waveform inversions
  - Found that slabs exhibit a smaller impedance jump across the d660 but a steeper gradient below the d660 compared to other regions
  - Suggested that basalt accumulates at the d660, especially in subduction zones, but decreases significantly below it, forming a harzburgite-enriched layer

- **Upper-mantle structure beneath Alaska imaged by teleseismic S-wave reverberations** *May, 2021 - May, 2023*
  - Imaged the Moho and mantle transition zone (MTZ) discontinuities beneath Alaska by stacking long-period teleseismic SH waves
  - Observed crustal thickness is generally consistent with surface topography and gravity measurements
  - Suggested that the Pacific slab may have penetrated into the upper MTZ under central Alaska but not under the Alaska Peninsula

- **Thermoelasticity of phase D and implications for low-velocity anomalies and local discontinuities at the uppermost lower mantle** *Sept., 2019 - Sept., 2021*
  - Obtained elasticity and density of phase D under the lower-mantle conditions
  - Proved that the accumulation of phase D may account for seismic anisotropy rather than low-velocity anomalies in the uppermost lower mantle (ULM)
  - Suggested that the decomposition of phase D in the ULM causes a density jump, possibly explaining some discontinuities in subduction zones

- **Compositional and thermal state of the lower mantle from joint 3D inversion with seismic tomography and mineral elasticity** *Oct., 2018 - June, 2023*
  - Inverted for the 3D chemical composition and thermal state of the lower mantle based on seismic tomography and mineral elasticity data
  - Found that velocity heterogeneities in the upper lower mantle mainly result from thermal anomalies, whereas those in the lowermost mantle mainly result from compositional or phase variations
  - Found that LLSVPs have ∼500 K higher temperature, higher Bridgmanite and iron content than the ambient mantle, supporting the origin from an ancient basal magma ocean

- **Elasticity of akimotoite under the mantle conditions: Implications for multiple discontinuities and seismic anisotropies at the depth of ∼600-750 km in subduction zones** *Oct., 2017 - Sept., 2019*
  - Calculated the elasticity of akimotoite under the mantle conditions using first-principles calculations
  - Estimated the V_P, V_S, and density contrasts caused by the akimotoite-related transitions
  - Proved that the discontinuity at the depth of ∼700-750 km in cold slabs could result from the decomposition of pyrope rather than the akimotoite-bridgmanite transition

Skills

- **Programming Languages:** Python, Matlab, C, Fortran
- **Other Tools & Technologies:** GMT, Quantum Espresso, VASP Origin

Honors and Awards

- **National Scholarship** *2019*
  University of Science and Technology of China
- **Outstanding Student** *2015*
  Nanjing University
- **Cyrus Tang Scholarship** *2014 - 2017*
  Cyrus Tang Foundation
- **National Scholarship for Encouragement** *2014 - 2016*
  Nanjing University
